

Power BI Day 1

One-day live course - virtual or at your offices

Every month the same figures go into the same spreadsheet report, and every follow-up question means building it again. Power BI turns your data into an interactive report that answers those questions with a click. This day takes your team from a first look at Power BI Desktop to a finished sales report, published and shared in the Power BI Service.

What you will be able to do

- Load an Excel table into Power BI Desktop and check it is structured correctly for analysis
- Build tables, a matrix and cards, and change how each value is calculated
- Add visual calculations such as profit ratio, share of total and a running total
- Filter a report with slicers and the Filters pane, including Top N and date ranges
- Choose the right column, bar, line or pie graph for the question being asked
- Build an interactive sales report and publish it to the Power BI Service

The day at a glance

- Getting started - what Power BI is, a tour of the interface, and loading the data
- Creating tables - number formats, sorting, styling, cross filtering and methods of aggregation
- Cards, matrix and visual calculations - key figures, drill down and percentages of total
- Filters and slicers - text, number and date slicers, and visual, page and report filters
- Column, line and pie graphs - picking the graph to fit the question, then formatting it
- Interactive report and publishing - build the sales report and share it in the Service
